Abstract

Learning or electronic learning, which means taking and giving education through digital media computer internet i.e., teaching work using electronic media internet computer etc. Electronic learning means e-learning in a way, e-learning is its various forms. If the teaching work that is done by the government is called e-learning, then overall, as seen in the beginning, the concept of learning is completely new, and its use is due to the electronic age. It is completely different from traditional education or traditional learning and the importance of e-learning through modern technology like internet computer etc. It is also called computer-stimulated learning, which is used in many senses and is more related to learning technology i.e., advanced learning technology and computer network internet and multi-media technology is used online. Teachers and those who are learners are both connected to each other through electronic circuits and through this education is exchanged.

Keywords: Electronic, e-learning, internet, traditional, technology.

Introduction

Today, online education has been introduced in many higher institutions, the facility of online technology is also being provided to individual students and in our research study it has been found that in general all students are satisfied with learning or electronic learning and eLearning is also more effective and useful than traditional learning system. But as technology and online learning systems improved, the concept of learning became even more popular and today many millions of students are studying many subjects online and e-learning is not limited to this, but many schools and universities are also e-commerce. Online learning is easier and more flexible than learning in traditional classrooms, and this learning system is being used to the maximum in individual institutions as this system is less expensive. The trained persons are also appointed, the help of trained persons is also taken for computer online and internet services, today the promotion of online education or online learning is happening amazingly fast and one of the reasons for this is that the importance of internet and computer has increased in all areas. Facilities for research studies are being provided by developed research institutes and open universities, communication media and e-learning are also being used for the medium of communication i.e., not only individual but also communication mediums and e-learning for less e-

education and community learning and some such necessary activities are being done under it. The room means that it is different from the traditional classroom and overall, it creates online classes and highly effective and very suitable mediums for learning and in today's circumstances. Learning in the classroom requires many actions and resources and eLearning is becoming more effective and comprehensive than this. It is said that it is a new concept in the field of education and under this, communication of the text item is done using internet computers and technology. With the help of this technology, the proper environment for learning is created for teachers and students. Education, which you know is a life-long process, then it can be made even more effective and promoted. This e-learning of society and community through this learning is quite easy, which eases learning, it helps learning, learn about the key features of e-learning. The second feature is that the presentation and communication of the text item is done on the computer internet, thirdly, the learning environment is expanded to teachers and students using the Internet. This environment is friend's student centered i.e., in the traditional classroom, the teacher was centered i.e., the teacher-centric environment was online or online. In e-learning, the environment of our classroom is student-centric. If the new type is life-long education, then creates an environment and provides real and comprehensive

learning opportunities to society. Friends, e-learning or electronic learning is a broad concept. Computers and the Internet edit this type of learning. It is not a system but a new education system that provides education or learning opportunities to all higher education and most importantly, it is a more comprehensive and important education system, by which ownership of the text is developed and its effectiveness is not only the same as traditional education but also more and one more thing you need to know is from learning or electronic learning. Some other terms are also related i.e., the other terms related to e-learning online act online education distance learning i.e., distance learning and technology base training web-based training remote learning and computer-based training are all part of electronic learning or to a considerable extent related to electronic technology. There is a much broader term, and this type of act is arranged in the context of computer. Learning is included within the technical terminology. Many definitions of learning have been given by many ideas. Some of these important definitions we will see that by incorporating effective teaching and learning processes, learning is edited, and it is done not only at the local level but also in a way. If it is organized or broadcast from it, it can be provided an opportunity to gain experience simultaneously at the world level or at the global level, according to which education and training is given by e-learning with the help of notification communication and the activities of training that take place. The processes of learning and training of the student are not mentioned in it, but the knowledge and skills are best imparted according to the needs of the student. This includes the communication of instruction partially or completely with the help of electric passengers and web site and internet or multimedia CD ROM according to the branded hall in e-learning. If it is done from DVD, it is called e-learning. The Internet is used according to the daily class. Internet technology communicates text, and it increases the tendency to learn and remember in students who are our thinkers. The second is that it uses authentic technology of internet for communication and thirdly e-learning is to broadcast. Learning solutions are more meaningful and effective than the traditional system and these pure notifications are provided to the required person at the right time and at the right place using proper means. What are the major features of electronic learning? What is the electronic act, then many universities in India have the facility of online education. Indira Gandhi National Open University Sikkim Manipal University Rajshri Tandon Open University is the main feature. The first is that through online education, you can do a course from any university in the country and abroad sitting at home, secondly, many technologies are used in the system, which are used to email video conferencing blog bulletin boards discussion boards and apart from this, if you are used to any service or any work, even while in it. Even while serving, you can do online courses to skill your skills. The fourth feature is that it is more useful for students living in economically weaker and remote areas and nowadays through virtual labs you can also do practical work sitting at home. It can be made interesting and fun and as well as various online courses available from certificate to higher degree. Now let us see which are the main types of e-learning, so there is not only one method in e-learning, but many types of teaching methods and techniques are used in it. What is the purpose of e-learning, even if the purpose of e-learning is, learning, which we call it, initially it did not get as much boost but later as the internet and electronic devices. People started to understand its importance and in fact, there were

many concepts behind promoting education or e-learning, such as it could become a boon for students who had to go far to get education, besides e-learning. Instead of traditional education, it is an innovative education system and those who cannot get education from good schools also get opportunities to get education from good teachers. Used in classroom teaching in a coordinated manner, the forms are directed to students and can be worked with the help of means of information and scientific work. Certain objectives can be achieved such as communication and communication of the text, facilitating education at the community and global level, providing opportunities for free learning and equal opportunity education for all Providing equal opportunities to mixed mediums Arranging education processes from e-learning in open universities Besides promoting online education system, increasing the practice of research studies from online education and the most important use of learning is that it can make higher education frugal. This learning is used all over the world with the help of CD ROM, it is like remote education i.e., our distance learning and it uses computer-based mediums and under this communication and communication is done with the help of mediums. Medium: E-text, textbooks, and magazines are used in this visual medium, which is only satellite broadcast, television etc. and the medium of communication which is in e-learning can be divided into two classes. Asynchronous medium and synchronous medium. Asynchronous medium means such a teaching system or a method of reading at a time in which there is no real-time contact between the teacher i.e., the teacher and the learner. The second is synchronous medium under which teachers and students can contact each other in real time and get their doubts resolved by using internet live chat call video conferencing and teleconferencing. In the end, let us see what the advantages and disadvantages of learning are, so friends, by sitting in a classroom or in a traditional classroom, you can interact more with the teacher, but online learning or e-learning has its own benefits and due to these benefits. E-learning is getting a lot of importance today and because it has made education much easier and more effective, what are its benefits i.e. what are the benefits of eLearning, then the biggest advantage is that you can easily learn it anywhere at any time i.e. you do not have any restrictions in time, nor do you need to go to a class room when you are in class. If you miss a class, then you must learn that subject yourself or take the help of your friends, but through e-learning, you can access the best contacts for unlimited time and you cannot understand things that are not understood by watching them repeatedly. Apart from this, if you are not able to go to school or college for any reason, then you can read and learn any subject with the help of the Internet, apart from this, it is also beneficial from the point of view of environment in terms of eLearning or electronic learning. Because here the information is stored in the application instead of books which also helps to save our environment, there is some harm or harm or even e-learning so if you are serious about your learning, then there is no problem in online learning, but you do not have self-discipline then if you do not study without saying, then e-learning. Apart from this, only a learning environment like a school classroom can never give you learning, in this you are able to have face to face interaction with the teacher because in the classroom you are able to interact with the teacher. Apart from this, you can learn simple topics through e-learning, but online learning is not amazingly effective in more complex and difficult topics that can only be understood by practical.

Challenges in Online Education in India

After the end of Covid-19, the promotion and spread of online education is happening extremely fast, what will be the benefits or disadvantages of online education, it will not be known in the future, but at present, students and teachers are facing many types of problems. The following is an example of some of these problems. ("2017 THOR QUANTUM RS26 - rvs - by owner - vehicle automotive sale")

- 1. Online Learning can Feel Lonely:** Everyone learns in their own way. Some students could work independently, while others have easy access to professors or peers in their campus community. The good news is that online virtual classroom platforms are working to fill these gaps by creating a range of tools to recreate a sense of community in virtual environments that engage students in live learning. Online learning should support the social side of learning as well as the effectiveness of traditional classrooms.
- 2. Online Learning Requires Self-discipline:** Supporting the above behaviors, taking part in the community, and attending classes increase your responsibility. If students feel they are not being taught well, they may not have the self-discipline to attend lessons fully on their own. Attending a virtual class in real time rather than an online course gives you a greater sense of responsibility. Tools such as real-time quizzes help assess understanding in real-time, and breakout rooms encourage group activity. These tools help increase accountability and engage students.
- 3. Online Teaching Requires More Training for Teachers:** In online courses, the instructor has a great curve and more power to create a successful online course. Teachers must have a deep understanding of different approaches to teaching and learning to avoid duplicating the physical classroom environment and losing all the benefits and complementary tools that e-learning and learning offer. Of course, teachers also need proper training to manage the technical side of e-learning: video and audio recording equipment, classroom software and virtual courses, and of course learning management software (LMS). The combination of all these new skills presents a steep learning curve for teachers, but a thoughtful investment in proper training pays off for institutions, teachers, and students tenfold!
- 4. Online Classes Facing Technical Difficulties:** The classic pitfalls of online learning center around technical problems. "Nothing disrupts an online lesson more than audio, video, or connection issues." ("Ultimate guide to online high schools in South Africa - Fundi Connect") Many times in the past, students had to download and/or install cumbersome apps or technology that supplied inconsistent performance. "Luckily nowadays, online classes can be accessed through the click of a link without the need to install anything." ("Top 5 Advantages & Disadvantages of Online Learning [2023] | Kaltura") ("Top 5 Advantages & Disadvantages of Online Learning [2023] | Kaltura") Internet connections have improved dramatically around the world. Plus, people's devices have gotten a lot better.
- 5. Online Learning means more Screen Time:** In 2022, it is almost inevitable, but so is the screen time we spend. Unfortunately, online courses contribute to this problem. Too much screen time can cause all kinds of physical ailments, like bad breath or headaches. But it can also be challenging for students who have difficulty learning or

focusing on screens. Furthermore, the Internet is poised to divert students' attention from educational material to social networks and entertainment at the same time. The best online learning platforms and software include a variety of tools and features to keep students engaged and engaged.

- 6. There is a Lack of Development of Communication Skills in Online Students:** Elearning methods have proved to be highly effective in enhancing the learning experience of the students. However, improving students' communication skills is often neglected in online courses. Because online programs lack face-to-face interaction between peers, students, and faculty, students may feel unable to work effectively in groups. Neglecting the communication skills of students many students have academic knowledge but are not able to communicate their knowledge to others.

Future of Online Education in India

The spread of COVID-19 and the ongoing lockdown has taken a toll on India's education system. Children are unable to continue their studies due to people staying locked in homes for months. What should have been joy and happiness turned into a disaster. They have education, so the government must find another way, the other way is online education. According to UNESCO, 1.37 billion people have been affected by the closure of schools and universities since the pandemic began. Students from 138 countries. About 60.2 million schoolteachers and university professors are not in the classroom. Due to the lockdown across the city, e-learning is the best choice. College professors post accounts on video chat sites like Zoom, Skype, Google Classroom and Meet to connect with students. While these new media make content available at any time and on any digital platform, there is a challenge for administrators and students alike. Today's digital media are a combination of traditional and traditional learning methods such as books, notebooks, and digital software such as e-books and PDFs.

Online Learning Opportunities in India

Digitalization of education in a developing country like India has many opportunities. India is the second most populous country in the world, while the resources of education are less in proportion to its population in India, so intellectuals and the government are giving a lot of emphasis on online education because it is a medium through which education in a country with a large population like India can be reached to rural areas and every person. There was no distinction between the poor and the rich in the field of education. The online and virtual world has made a huge contribution, especially towards the educational scenario. Examples of some of these key points are as follows:

Competence: Teachers can help students learn online more effectively. Teachers can use a variety of online learning tools such as videos, PDFs, and podcasts as part of the curriculum. Teachers can become more effective teachers by expanding curriculum beyond traditional textbooks and incorporating online resources.

Time and Place Access: Another advantage of online learning is that it allows students to attend classes from anywhere. This allows schools to reach a large network of students without geographic limitations. Online lectures can also be recorded, saved, and shared for later viewing. This makes the teaching material easily available to the students. As a result, online learning offers students flexibility in terms of time and place in their education.

Moving on to Different Topics: All children have special needs and deserve a good education. Some students prefer visual learning, while others prefer auditory learning. Similarly, some students do well in the classroom, while other students prefer to work alone in large groups and are easily distracted. With so many options and resources available, online courses can be customized in many ways. This is the best way to create the best learning environment for all the students.

Improving Students' Attendance: There is a slight risk of students missing a lecture as the online courses can be taken at home or elsewhere.

Competency: Another advantage of studying online is saving money. Online courses are cheaper than traditional courses. This is because online learning saves students the cost of transportation, lunch, and especially materials. Furthermore, all the course material or learning material is available online, creating a paperless, cost-effective, and eco-friendly learning platform.

Online learning opportunities

With the rapid growth of internet users in India, it is seen as a practical alternative to traditional education if well planned and managed. With online learning options, many teachers consider it as the best way to learn in the future. Some online learning opportunities in the current pandemic situation; Students can study remotely from anywhere in the world. Virtual classrooms can supply high quality education by ending the risk of virus transmission. Students from rural areas do not need to travel much within the country or abroad to attend a good institute, they can use online courses to reduce the cost. But this will require a good network connection and access to sophisticated learning technologies.

Conclusion

With the advent of e-learning, the face of education in developing countries like India has changed. Significant improvements in literacy have been achieved through the ability building of municipal leaders. Live Business. This applies to countries where the cost of education is high. Economic inequality is real. And the field of e-learning is growing rapidly in countries with limited resources. A hybrid model (online and offline) will not completely replace traditional education. But in the future, it will be more common. Best for eLearning is a three-step process of input, distribution, and quality content. Satellite technology has reduced the cost of communication through various electronic devices and has enabled students to access information and educational materials while searching for a suitable job. as well as around the world. However, there is still a long way to go before attention is focused on the technology and infrastructure needed to improve opportunities in the sectors. Cooperation with companies and schools is possible.

The government's e-learning program has the potential to revolutionize education in the future. Significant curriculum reform is needed to close the gap and make graduates get job ready. We need to use technology to change the curriculum and make it more effective. It is also an innovative idea to offer courses in multiple languages. Promote benefits and opportunities for rural youth in India. Developing a relationship-building strategy in e-learning requires innovation.
